Populating carousels with historic data

In this feature, you can:

- Populate carousels with historic data

To populate carousels by rule, do the following:

1. Login to your WebStore Manager.
2. Go to **Design & Content > Carousel Builder**.
3. Select or create a new carousel.
4. Select **populated by history**.

Populating carousels with historic purchase data

- Every time a product is bought, your store remembers which products were bought with it.
- When *Widget_A* is bought with *Widget_B* that connection is stored. This carousel will then use this data to display products that were bought together.
- This carousel should only be included on product pages. On the product page for *Widget_A* this carousel will look for other products that were bought with it.

Note: The panel only makes sense to use after the store has built up a history of purchases.

Options that Affect this Carousel

- There are two global options that have an effect on the products displayed in this carousel.
- Because they are global options you cannot set them 'per carousel'.

Ordering of Items

- By default, we arrange the items in the carousel by the frequency with which they were bought together.
- It is possible to change this to display the associated items alphabetically.

Number of Items to Display

- This allows you to determine the number of items to display on this carousel.
- This overrides the global setting found in the WebStore Configuration page called **Change the number of related items displayed**.
