

# Hidden surcharge (Authorize.net)

Last Modified on 03/05/2023 5:54 pm IST

Authorize.net does not allow settling transactions for more than the original amount.

We do, however, have an option available that authorizes a hidden surcharge.

It's a feature which is used together with Authorize.net and delayed capture. Since Authorize.net doesn't allow to increase the order amount with delayed capture, this feature accommodates it by adding a surcharge so you can adjust the pricing however you would like on an order.

- The user is not aware of the surcharge e.g basket, checkout, order conf, order history, etc.
- When the order arrives on the POS you can make the appropriate adjustment to capture the correct/final amount.

**NOTE:** it requires enabled Delayed Capture

## How to Enable

It is set up on the Payment Plugin Configuration page. The option is called:

✓ Add a hidden authorization surcharge to transactions (requires WSM configuration option 'Set Hidden Authorization Surcharge % for supported payment plugins' and Delayed Capture)

### Authorize.net Configuration

NOTE: This is the default payment gateway plug-in and cannot be disabled.

API Login ID:	<input type="text" value="5vqN46Dx"/>
Transaction Key:	<input type="text" value="2345Ba4trxzj8LbA"/>
<input checked="" type="checkbox"/>	Enable delayed capture
<input checked="" type="checkbox"/>	Add a hidden authorization surcharge to transactions (requires WSM configuration option 'Set Hidden Authorization Surcharge % for supported payment plugins' and Delayed Capture)
<input type="checkbox"/>	Use Strict AVS (X,Y)
<input checked="" type="checkbox"/>	Enable CCV Check (transaction is voided if CCV validation fails)
<input type="checkbox"/>	Process AMEX cards that are not returning a CVV code
<input type="checkbox"/>	Enable transactions to be accepted and authorized, when they are being held for merchant review. The merchant may customize the customer response in the Merchant Interface
<input type="checkbox"/>	Enable tokenisation support (shoppers can save cards at checkout)

This option lets you set the percentage of the order total that is additionally preauthorized on each transaction with supported payment plugins. Enter the amount as a percentage, e.g 25 = 125% of the order total will be authorized. Requires Delayed Capture and other corresponding options to be enabled in the payment processor configuration panel.
