Restrict purchasing to in-stock quantity only

Last Modified on 17/09/2025 1:35 pm IST

Restrict purchasing to in-stock quantity only ensures that customers can only purchase items that are currently in stock and available for immediate shipment. If a product's inventory level is zero or below a specified threshold, customers won't be able to place an order for that item until the stock is replenished.

This restriction helps businesses manage their inventory more effectively and prevents customers from placing orders for products that are temporarily out of stock. By enforcing this limitation, you can avoid overselling, reduce the risk of backorders, and ensure that customers only order items that are immediately available for shipment.

How to enable

1. In WSM, under **Settings**, select **All config options**.

2. Enable the **Restrict purchasing to in-stock quantity only** option.

3. Save changes.
