

Stripe Elements

Last Modified on 07/04/2026 10:54 am IST

Stripe Elements is a powerful suite of customizable UI components designed to optimize your checkout experience. With dynamic payment methods, seamless autofill, and full design control, you can offer your customers a fast, flexible, and polished way to pay.

PAYMENT

The screenshot displays the Stripe payment interface. At the top, there are two large buttons: "Using my PayPal account" and "Using my Credit/Debit Card". Below these are three smaller buttons for "Card", "Amazon Pay", and "Revolut Pay". The "Card" button is selected and highlighted with a blue border. The form includes several input fields: "Card number" (with a placeholder "1234 1234 1234 1234" and Visa/Mastercard logos), "Expiration date" (placeholder "MM / YY"), "Security code" (placeholder "CVC" and a "123" icon), "Country" (a dropdown menu showing "United Kingdom"), and "Postal code" (placeholder "WS11 1DB"). At the bottom, there is a dark green button labeled "CONFIRM & PAY NOW".

Main features and benefits

Dynamic Payment Methods

Stripe Elements can dynamically display over 40 supported payment methods based on the shopper's location, currency, and device. These include Klarna, Afterpay/Clearpay, Affirm, Cash App, PayPal, Google Pay, Apple Pay, and others. Methods are automatically configured through Stripe and do not require individual setup.

Autofill with Link

Link is Stripe's autofill system that stores payment and shipping details for customers. When enabled, returning customers can complete checkout more quickly by reusing their stored information. Link works across all Stripe-enabled sites that support it.

Complete Customization

Elements can be styled to match the visual design of a website. You can control layout, spacing, and appearance to create a cohesive user experience within the checkout flow.

Compatibility

Stripe Elements works with existing Stripe accounts and requires no new credentials or separate onboarding. It uses the current account configuration and inherits existing security and compliance settings.

On-page error handling

Customers will no longer need to reload the page to verify their payment details. Stripe Elements will dynamically detect errors with payment details before reloading the page, allowing much quicker correcting.

Refurbished Saved Cards

Stripe Elements allows customers to manage their saved card details during checkout. They can update or remove stored cards directly from the payment form without needing to access a separate account management page.

How to Configure in Stripe

Steps:

1. Log in to Stripe.

- Go to [Stripe Dashboard](#).
- Log in with your Stripe account credentials.

2. Access Payment Methods Settings.

- Once logged in, click on **Settings** (usually a gear icon in the lower-left corner).
- Under **Payments and Payouts**, click **Payment methods** or directly go to: [Stripe Payment Methods Settings](#).

3. Enable Payment Methods.

- You'll see a list of all available payment methods (e.g., Card payments, Apple Pay, Google Pay, ACH, etc.). If you have multiple payment method configurations set up, you will instead see the configurations here. Clicking into one of them will list the payment methods. Note that currently, Stripe Elements only uses the methods set up in **Default**.
- For each payment method you want to enable: Click the toggle switch next to it to **enable** it.
- Some methods may require additional setup (e.g., Apple Pay requires domain verification).
- For card payments, make sure your business details are complete and verified, as Stripe needs this to accept payments.

After enabling the desired payment methods, make sure any prompts to **save** your changes are completed.

How to Enable Stripe Elements in WSM

Steps:

1. Go to WSM under **Orders** and select **Stripe Elements**.

3. Enable the **Enable Stripe Elements** option.

4. Click **Save** at the bottom of the page.

The screenshot displays the Stripe Elements configuration interface. At the top, there is a checkbox labeled "Enable Stripe Elements" which is checked. Below this, the "Appearance" section is visible, containing a "Theme" dropdown set to "Default". There are four color selection options: "Primary Color (Icons, Payment method labels)" with a blue swatch and a "Sample" link; "Text Color (Input Labels)" with a black swatch; "Background Color (Inputs, Icons)" with a light gray swatch; and "Error Color (Missing details, Expired Card)" with a red swatch and a "Sample" link. A "Reset To Original Colors" button is located at the bottom of this section. The "General Layout" section below it has three radio button options: "Start checkout with payment options collapsed" (unchecked), "Display payment method options in a set of horizontal tabs" (checked), and "Display payment method options in a vertical accordion" (unchecked). To the right of these options is a preview window showing a horizontal tabbed interface with buttons for "Card", "EPS", "Klarna", "Bancontact", and a dropdown arrow.

The settings allow you to customize the layout and style. To view and manage available payment methods, visit your [Stripe Dashboard](#) and enable or disable options as needed.

If the integration is working but certain payment methods are not available, it may be due to the order being ineligible (e.g., the order amount is too low or the customer is located in a different country), or your Stripe account itself may not be eligible. For any questions regarding this, we recommend contacting Stripe support directly.
